Research Summary

Chemical anchors are specialized fastening systems used in construction and engineering applications to securely attach various fixtures and structures to concrete, masonry, or other solid substrates. These anchors are designed to provide reliable and long-lasting bonding strength in situations where traditional mechanical anchors may not be sufficient. The chemical anchor system typically consists of a two-part epoxy or polyester resin that is mixed and injected into a pre-drilled hole in the substrate. As the resin cures, it forms a strong chemical bond with the surrounding material, creating a durable anchor point. Chemical anchors are widely used in construction projects to secure items such as steel reinforcement bars (rebar) in concrete structures, bolts for heavy equipment installations, and brackets for mounting fixtures to walls and floors. They offer excellent load-bearing capacity, versatility, and resistance to environmental factors, making them essential for critical and high-stress applications in the construction industry.?

The major global manufacturers of Chemical Anchors include MKT FASTENING LLC,
