### Research Summary

A Chemical Mechanical Polishing Machine (CMP) is a specialized piece of equipment used in the semiconductor manufacturing industry to achieve a flat and smooth surface on semiconductor wafers during the fabrication of integrated circuits. CMP is a critical process in semiconductor manufacturing, as it removes excess material from the wafer's surface to create precise and uniform layers required for the construction of integrated circuits. The CMP machine consists of a rotating polishing platen or table and a polishing pad that is chemically treated and coated with abrasive particles. The wafer is held against the polishing pad while the platen applies controlled pressure and rotation, allowing the chemical slurry and mechanical action to remove material from the wafer's surface. The CMP machine ensures the required planarity and uniformity in the wafer's layers, enabling the production of high-performance and reliable semiconductor devices. It is an essential tool in modern semiconductor manufacturing processes, allowing for the production of smaller, faster, and more complex integrated circuits used in various electronic devices.

The major global manufacturers of Chemical Mechanical Polishing Machine (CMP) include Applied Materials, Ebara Corporation, KC Tech, ACCRETECH, Tianjin Huahaiqingke, Logitech, Revasum, Alpsitec, etc. The global players competition landscape in this report is divided into three tiers.
