Research Summary

A chemisorption analyzer is a specialized instrument used in surface science and materials characterization to study the interactions between gases and solid surfaces. Chemisorption is a surface phenomenon where gas molecules are adsorbed and form chemical bonds with the atoms or molecules on the solid surface. The chemisorption analyzer measures the quantity of gas molecules adsorbed on the surface and provides valuable information about the surface area, surface active sites, and surface reactivity of materials. The analyzer typically consists of a sample chamber, gas dosing system, temperature-controlled heating stage, and a detection system to monitor gas adsorption and desorption. Chemisorption analyzers find applications in catalyst research, materials development, and environmental studies, allowing scientists and researchers to better understand the surface properties and performance of materials used in a wide range of industrial and scientific applications.

The major global manufacturers of Chemisorption Analyzer include Micromeritics Instrument, Quantachrome Instruments, MicrotracBEL, Xianquan, etc. The global
