### Research Summary

Chemotherapy devices refer to specialized medical equipment and systems used in the administration and delivery of chemotherapy treatments to cancer patients. These devices are designed to accurately and safely deliver chemotherapy drugs into the patient's body, either through intravenous (IV) infusion, oral administration, or localized delivery. Chemotherapy devices can include IV infusion pumps, which control the rate and dosage of chemotherapy drugs administered directly into the bloodstream, ensuring precise delivery and minimizing the risk of medication errors. Other devices may be used for oral chemotherapy, allowing patients to take their medication in the form of pills or capsules. Additionally, certain advanced devices are used for targeted or localized delivery of chemotherapy to specific areas, such as tumors or cancerous tissues, to enhance treatment effectiveness while minimizing side effects. Chemotherapy devices play a critical role in cancer treatment, enabling oncologists to tailor treatment regimens to individual patients' needs, improve therapy outcomes, and enhance the overall quality of life during cancer treatment.
