Research Summary

A chip antenna is a compact and miniaturized antenna designed to be mounted directly on a printed circuit board (PCB) or integrated into electronic devices. Chip antennas are commonly used in wireless communication applications, such as Wi-Fi, Bluetooth, GPS, and cellular devices, to transmit and receive signals. They are made using microstrip technology, where the antenna elements are etched onto a ceramic or laminate substrate and covered with a protective layer. The compact size of chip antennas makes them ideal for space-constrained applications, and they offer advantages like ease of integration, cost-effectiveness, and good performance within a specific frequency range. However, due to their small size, chip antennas may have slightly lower gain and efficiency compared to larger, traditional antennas. Despite this, chip antennas have become widely adopted in various wireless devices, contributing to the advancement of wireless communication technologies.

The major global manufacturers of Chip Antenna include Vishay, INPAQ, Antenova, Johanson Technology, Mitsubishi Materials, Abracon, TAIYO YUDEN, Linx
