Research Summary

A chiral high-performance liquid chromatography (HPLC) column is a specialized chromatographic column used in analytical chemistry to separate and analyze enantiomers, which are molecules that are mirror images of each other but cannot be superimposed. Chiral HPLC columns are designed with a chiral stationary phase, which contains a chiral selector that interacts differently with the enantiomers based on their spatial arrangement. This results in differential retention times and elution orders for the enantiomers, allowing for their efficient separation. Chiral HPLC is essential for pharmaceutical and chemical industries, as many drugs and compounds exist as enantiomers, and only one enantiomer may exhibit the desired biological activity while the other could be inactive or even have adverse effects. Chiral HPLC plays a crucial role in determining the enantiomeric purity of drug substances, ensuring the safety and efficacy of pharmaceutical products.

The major global manufacturers of Chiral HPLC Column include Daicel Corporation, Merck (Sigma-Aldrich), YMC, Phenomenex, Osaka Soda (Shiseido), Avantor
