Research Summary

Chitin is a natural polysaccharide and a major structural component found in the exoskeletons of arthropods (such as insects and crustaceans) and the cell walls of fungi. It is one of the most abundant biopolymers in nature, second only to cellulose. Chitin is composed of repeating units of N-acetylglucosamine, which are linked together in a linear chain. Due to its unique properties, chitin has various applications in different industries. It is a biodegradable and renewable material, making it an eco-friendly alternative to synthetic polymers in areas such as bioplastics, wound dressings, and agricultural products. Chitin also has potential applications in biomedical and pharmaceutical fields, as it can be modified to produce chitosan, a derivative with antimicrobial properties and wound-healing capabilities. Additionally, chitin is a valuable resource for the production of chitinase enzymes and chitin oligosaccharides used in various biotechnological applications. Its versatile properties and sustainable nature make chitin a promising and valuable material in the quest for more environmentally friendly and innovative solutions.

The major global manufacturers of Chitin include AgraTech, Primex, Advanced
