### Research Summary

Chlorinated paraffin is a group of synthetic chemicals composed of long-chain hydrocarbons with varying degrees of chlorination. It is produced by chlorinating paraffin wax, which is derived from petroleum or other sources of hydrocarbons. Chlorinated paraffins are classified into different grades based on their chlorine content, with higher chlorine content indicating higher levels of chlorination. These chemicals are primarily used as flame retardants and plasticizers in various products, including plastics, rubber, paints, adhesives, and sealants. Chlorinated paraffin's flame-retardant properties make it valuable in enhancing the fire resistance of materials, particularly in construction and automotive industries. However, due to concerns about their potential persistence in the environment and adverse health effects, some chlorinated paraffins have been restricted or phased out in certain applications and regions. As a result, there is an ongoing focus on developing safer alternatives with less environmental impact.

The major global manufacturers of Chlorinated Paraffin include INOVYN (INEOS), Danyang Auxiliary Chemical, Dover Chemical Corporation, KLJ Group, Huaxia
