Research Summary

Chlorothalonil (CAS 1897-45-6) is a synthetic fungicide and broad-spectrum bactericide used in agriculture to protect crops from various fungal and bacterial diseases. It is a white crystalline solid with the chemical formula $C_8Cl_4N_2$, and it belongs to the class of organochlorine compounds. Chlorothalonil is widely used to control diseases in crops such as fruits, vegetables, cereals, and turfgrass. It works by inhibiting fungal enzymes involved in cell membrane synthesis, leading to the prevention of fungal growth and spread. The effectiveness of chlorothalonil against a broad range of pathogens and its low mammalian toxicity make it a valuable tool in integrated pest management strategies for crop protection. However, due to its potential environmental impact and the development of resistance in some fungal populations, there have been efforts to use it judiciously and explore alternative disease management practices. Proper application and adherence to regulatory guidelines are essential to ensure its safe and effective use in agriculture.
