### Research Summary

Chromated Copper Arsenate (CCA) is a wood preservative that has been widely used to protect wood from decay and insect damage. It is a mixture of chromium, copper, and arsenic compounds that are pressure-treated into the wood to extend its lifespan and durability in outdoor applications. CCA-treated wood has been commonly used for a variety of outdoor structures, including decks, fences, playground equipment, and utility poles. The preservative works by preventing fungi and insects from attacking the wood fibers, thereby increasing its resistance to decay and pests. However, due to the potential health and environmental concerns associated with the release of arsenic, CCA-treated wood has been phased out in many countries for residential and consumer use. Today, alternative wood preservatives, such as copper-based compounds and borates, are preferred for certain applications to reduce environmental impacts and potential health risks.
