### Research Summary

A closed suction system is a medical device used to clear respiratory secretions from a patient's airway without disrupting their ventilation support. It is commonly used in intensive care units, operating rooms, and other medical settings where patients may require mechanical ventilation or have a tracheostomy tube. The closed system consists of a catheter enclosed within a sealed circuit, preventing any exposure of healthcare providers to potentially infectious secretions during the suctioning process. This closed design minimizes the risk of cross-contamination and reduces the spread of pathogens, making it a safer option for both patients and healthcare workers. Closed suction systems also help maintain positive end-expiratory pressure (PEEP) during suctioning, which is crucial for patients with compromised lung function. Additionally, these systems can help reduce trauma to the airway and minimize oxygen desaturation during suctioning, improving patient comfort and outcomes.

The major global manufacturers of Closed Suction System include Avanos, ConvaTec, Vyair, Smiths Medical, SUMI, R-Vent Medical, Medline, Delta Med, Vitaltec

Corporation, Intersurgical, PAHSCO- Pacific Hospital Supply, etc. The global players competition landscape in this report is divided into three tiers.
