Research Summary

Cloud computing stack layers refer to the different levels or components of cloud computing architecture that work together to deliver cloud services to users. The stack is typically divided into four main layers:

- 1. Infrastructure as a Service (IaaS):** This is the foundational layer of the cloud computing stack, where the physical hardware resources, such as servers, storage, and networking, are provided as virtualized resources over the internet. Users can rent and manage these resources on-demand, allowing for scalability and flexibility without the need for physical infrastructure.
- 2. Platform as a Service (PaaS):** The PaaS layer builds on top of the IaaS layer and provides a platform for developers to build, deploy, and manage applications without worrying about underlying infrastructure complexities. PaaS offers development tools, runtime environments, and databases to streamline the application development process.
- 3. Software as a Service (SaaS):** The SaaS layer is the topmost layer of the cloud computing stack, where complete software applications are delivered over the internet on a subscription basis. Users can access these applications through a web browser without the need for installation or maintenance, making it convenient and cost-

effective. 4. Business Process as a Service (BPaaS): Some cloud providers also offer BPaaS, which integrates various SaaS applications to provide end-to-end business process outsourcing solutions. BPaaS streamlines business operations by automating processes and workflows. Each layer of the cloud computing stack builds upon the one below it, allowing organizations to choose the level of abstraction that suits their needs, from managing infrastructure to using fully-fledged software applications. This layered approach enables efficient cloud service delivery and empowers businesses to focus on their core competencies while leveraging the benefits of cloud technology.
