Research Summary

A Cloud Content Delivery Network (CDN) is a distributed network of servers and data centers strategically placed across various geographic locations to deliver web content, videos, images, and other digital assets efficiently and quickly to users. CDN services are designed to reduce latency, improve website performance, and enhance user experience by caching and storing content closer to end-users. When a user requests content from a website, the CDN automatically routes the request to the nearest server in the network, reducing the distance and time it takes to retrieve the content. This not only improves loading times but also reduces the burden on the origin server, ensuring that websites can handle high traffic volumes without performance degradation. Cloud CDNs are particularly beneficial for global businesses with a wide user base, as they help to overcome the limitations of internet infrastructure and ensure a fast and reliable content delivery experience to users worldwide.

The major global suppliers of Cloud Content Delivery Network (CDN) include Akamai
