Research Summary

CMP (Chemical Mechanical Planarization) retaining rings are essential components in the semiconductor manufacturing process. They play a crucial role in holding the polishing pad in place and maintaining its position during the CMP process. The retaining rings are placed around the edge of the polishing pad and create a secure boundary to prevent any slippage or misalignment during wafer polishing. They are designed to be highly durable, resistant to chemical exposure, and capable of withstanding the mechanical forces applied during polishing. Properly designed and well-maintained CMP retaining rings ensure the uniform distribution of the polishing slurry and maintain the pad's integrity, resulting in consistent and precise material removal from the wafer surface. These components are critical in achieving the desired planarization and surface smoothness required for semiconductor wafers, contributing to the production of high-quality integrated circuits and electronic devices.

The major global manufacturers of CMP Retaining Rings include Willbe S&T, CALITECH, Cnus, UIS Technologies, Euroshore, PTC, AKT Components Sdn Bhd,
