### Research Summary

CMP slurry, short for Chemical Mechanical Polishing slurry, is a mixture used in the semiconductor manufacturing process to polish and planarize the surface of silicon wafers during fabrication. It typically consists of abrasive particles suspended in a chemical solution. The abrasive particles can be made of materials like silica, alumina, ceria, or other compounds, depending on the desired polishing characteristics. The chemical solution contains additives that help control the polishing rate, selectivity, and surface chemistry of the CMP process. During CMP, the slurry is applied to the surface of the wafer while it rotates against a polishing pad. The abrasive particles remove material from the wafer surface by mechanical action, while the chemical components of the slurry react with the surface to enhance the polishing process. CMP slurry is crucial for achieving the precise surface flatness and smoothness required for the fabrication of advanced semiconductor devices with multiple layers of materials.

The major global manufacturers of CMP Slurry include Entegris (CMC Materials), Showa Denko, FUJIMI INCORPORATED, DuPont, Merck (Versum Materials), Fujifilm, AGC, KC Tech, JSR Corporation, Anjimirco Shanghai, Soulbrain, Saint-Gobain, Ace
