Research Summary

Carbon nanotube (CNT) materials are a class of nanomaterials composed of cylindrical carbon structures with exceptional properties. These nanotubes consist of rolled-up graphene sheets, forming a tubular structure with diameters in the nanometer range and lengths varying from micrometers to centimeters. CNT materials are known for their exceptional strength, high electrical and thermal conductivity, and unique mechanical properties. They can be single-walled (SWCNT) or multi-walled (MWCNT) depending on the number of graphene layers they contain. Due to their extraordinary properties, CNT materials have a wide range of applications in various fields, including electronics, aerospace, medicine, and materials science. They are used as additives to enhance the mechanical strength of composites, as conductive components in electronic devices, and as drug delivery systems in biomedical applications. The unique combination of properties in CNT materials makes them promising candidates for future technological advancements and a subject of intense research and development.

The major global manufacturers of CNT Materials include Cnano, LG Chem, SUSN Nano, HaoXin Technology, Nanocyl, Showa Denko, Arkema, OCSiAl, Kumho
