Research Summary

Coal-based activated carbon is a porous and highly adsorptive material derived from coal, processed through activation techniques to create a large internal surface area. It is widely used in various applications due to its excellent adsorption properties, which enable it to remove impurities, contaminants, and pollutants from air, water, and other fluids. The activation process involves exposing the coal to high temperatures and gases, creating a network of pores and increasing its surface area. This unique structure allows coal-based activated carbon to effectively adsorb a wide range of organic and inorganic compounds, including volatile organic compounds (VOCs), heavy metals, and other harmful substances. It finds applications in water treatment, air purification, gas masks, respirators, industrial processes, and as an adsorbent in numerous chemical and environmental processes. The use of coal-based activated carbon offers an efficient and cost-effective solution for addressing various environmental and purification challenges across different industries.

The major global manufacturers of Coal-based Activated Carbon include Kuraray,
