Research Summary

Coalescers are specialized devices used in various industries to separate immiscible liquids, such as oil and water, from gas streams. They operate based on the principle of coalescence, which means merging or combining smaller droplets of one liquid phase into larger droplets for easier separation. Coalescers are designed with a porous media or mesh that allows gas to pass through while capturing and merging tiny liquid droplets. As the liquid droplets grow in size, they become heavy enough to separate from the gas phase due to gravity, enabling easy collection and removal. Coalescers are essential in oil and gas processing, petrochemical, power generation, and other industries where the removal of liquid contaminants from gas streams is critical to ensure equipment efficiency, prevent corrosion, and maintain product quality. They play a crucial role in protecting downstream equipment, such as compressors and turbines, by ensuring that liquids are effectively removed from the gas stream, thereby improving overall process performance and minimizing environmental impact.

The major global manufacturers of Coalescers include Parker, Sulzer, Pall, Eaton, Boll

& Kirch Filterbau GmbH, Filtration Group, CECO Environmental, Celeros Flow Technology, Wako Filter Technology, Hilliard Corporation, HYDAC, Gaumer Process, Jiangsu Xinzhiheng, Filter Concept, Henghe Shihua, etc. The global players competition landscape in this report is divided into three tiers.
