Research Summary

Coffee processing refers to the series of steps involved in transforming harvested coffee cherries into the beans that are roasted and brewed to make coffee. The process begins with the harvesting of ripe cherries, which are then processed through one of several methods, such as the washed (wet) method, natural (dry) method, or honey (semi-washed) method, depending on the region and desired flavor profile. In the washed method, cherries are pulped to remove the outer skin, and the beans are fermented and dried. In the natural method, cherries are dried whole, allowing the beans to absorb flavors from the fruit. After processing, the beans are hulled, sorted, and graded to remove defects before being packaged for export. The final processing step is roasting, where the beans are heated to develop their characteristic flavor. Each stage of coffee processing influences the final taste, aroma, and quality of the coffee.
