Research Summary

Cold-rolled silicon steel, also known as electrical steel or silicon electrical steel, is a specialized type of steel used in the manufacturing of electrical equipment and transformers. It is produced through a cold-rolling process that reduces the thickness of the steel while improving its magnetic properties. Cold rolling aligns the grain structure of the steel, reducing eddy current losses and enhancing its magnetic permeability, making it highly efficient for electrical applications. The low carbon content in cold-rolled silicon steel further enhances its magnetic properties and reduces core loss, making it ideal for constructing the cores of power transformers, electric motors, generators, and other electromagnetic devices. The unique combination of high electrical resistivity and excellent magnetic properties makes cold-rolled silicon steel a crucial material in the energy industry, enabling the efficient transfer of electrical energy and minimizing energy losses during power transmission and distribution.

The major global manufacturers of Cold Rolled Silicon Steel include China Baowu Steel Group, NSSMC, JFE Steel Corporation, Shougang Group, TISCO, APERAM, NLMK
