### Research Summary

Compostable and biodegradable plastics are types of environmentally-friendly materials that have the ability to break down naturally and safely in the environment. Compostable plastics undergo a specific process called composting, where they decompose into organic matter, carbon dioxide, and water in the presence of microorganisms, resulting in nutrient-rich compost. These plastics are designed to break down within a specific timeframe, usually in industrial composting facilities, and are suitable for use in products like food containers and packaging. On the other hand, biodegradable plastics can break down through natural processes over time, either in a composting environment or in natural conditions such as soil, water, or sunlight. Both compostable and biodegradable plastics help reduce plastic waste, environmental pollution, and their impact on ecosystems, making them valuable alternatives to traditional non-biodegradable plastics.

The major global manufacturers of Compostable & Biodegradable Plastic include
