Research Summary

Concrete admixtures are construction chemicals added to concrete during the mixing process to modify its properties and enhance its performance. They are used to improve the workability, durability, strength, and other characteristics of concrete, making it more suitable for specific construction applications. Common types of concrete admixtures include water-reducing agents, which improve the workability and reduce the water-cement ratio; air-entraining agents, which introduce tiny air bubbles to enhance freeze-thaw resistance; accelerating agents, which speed up the concrete setting and curing process; and retarders, which delay the setting time to allow for extended workability. Other admixtures, such as superplasticizers, shrinkage reducers, and corrosion inhibitors, are used to address specific construction challenges. Concrete admixtures play a crucial role in modern construction practices by allowing engineers and contractors to tailor concrete mixes to meet the requirements of various construction projects efficiently and effectively.

The major global manufacturers of Concrete Admixtures Construction Chemical include Sika, Sobute New Material, BASF, KZJ New Materials, GCP Applied Technologies, Fosroc, Mapei, Guangdong Redwall New Materials, Arkema, Kao Chemicals, Shijiazhuang Yucai, Shanxi Kaidi, Shangdong Huawei, Liaoning Kelong, Takemoto, Huangteng Chemical, etc. The global players competition landscape in this report is divided into three tiers.
