Research Summary

Conductive polymers, also known as intrinsically conducting polymers (ICPs), are a class of organic materials that have the unique ability to conduct electricity. Unlike traditional polymers, which are insulators, conductive polymers possess a conjugated pi-bond system that allows for the movement of electrons within their molecular structure, leading to electrical conductivity. These materials exhibit a wide range of properties, including flexibility, lightweight, and ease of processing, making them suitable for various applications. Conductive polymers find use in electronic components, such as capacitors, sensors, and transistors, where their conductivity and processability enable advanced miniaturization and flexible electronic devices. They also hold promise in energy storage devices like batteries and supercapacitors and have applications in antistatic coatings, electromagnetic shielding, and biomedical devices. As research and development continue, conductive polymers offer great potential for revolutionizing electronics and other industries with their unique combination of electrical properties and material versatility.

The major global manufacturers of Conductive Polymers include 3M, RTP Company, Parker Hannifin, Sumitomo Chemical, Premix OY, Heraeus Group, The Lubrizol Corporation, Covestro, Polyone Corporation, Celanese, Rieke Metals Inc., Merck Kgaa, DuPont, Sabic, Kenner Material & System, Westlake Plastics Co., etc. The global players competition landscape in this report is divided into three tiers.
