Research Summary

Cone Beam Computed Tomography (CBCT) for orthopedics is an imaging technology used to generate three-dimensional images of bones, joints, and surrounding soft tissues with high spatial resolution. Unlike conventional CT scans, which use a fan-shaped X-ray beam, CBCT uses a cone-shaped X-ray beam, allowing for a larger field of view and faster scanning times. In orthopedics, CBCT is particularly useful for diagnosing complex musculoskeletal conditions, planning surgical interventions, and evaluating post-operative outcomes. CBCT images provide detailed information about bone density, alignment, fractures, and abnormalities, allowing orthopedic surgeons to accurately assess the extent of injuries or conditions and plan appropriate treatment strategies. CBCT technology has revolutionized orthopedic imaging by providing more comprehensive and detailed images while minimizing radiation exposure compared to traditional CT scans.
