### Research Summary

Construction robots are autonomous or semi-autonomous machines designed to perform various tasks in the construction industry. These robotic systems are equipped with sensors, cameras, and advanced control algorithms that enable them to execute complex construction operations with precision and efficiency. Construction robots can handle tasks such as bricklaying, concrete pouring, welding, demolition, and excavation, among others. By automating labor-intensive and hazardous activities, construction robots help enhance safety on construction sites while increasing productivity and reducing construction timelines. These machines can work continuously, 24/7, and can be remotely controlled or operate collaboratively with human workers. The use of construction robots is revolutionizing the industry by improving construction quality, optimizing resource utilization, and contributing to sustainable and cost-effective construction practices.
