Research Summary

Contact lenses for myopia control are specialized lenses designed to slow down the progression of nearsightedness (myopia) in children and young adults. These lenses, often referred to as orthokeratology lenses (Ortho-K), multifocal contact lenses, or soft myopia control lenses, work by reshaping the cornea or altering the way light focuses on the retina. By wearing these lenses regularly, usually during sleep or throughout the day, they exert specific optical effects that help to inhibit the elongation of the eyeball, which is a major factor contributing to myopia progression. Contact lenses for myopia control aim to reduce the rate at which the prescription changes over time, potentially leading to less severe myopia and a lower risk of associated eye conditions later in life. These lenses are prescribed and fitted by eye care professionals, and their effectiveness varies from person to person, so regular eye exams and adjustments are necessary to ensure optimal results and eye health.
