Research Summary

A contactless inductive slip ring is a specialized device used to transmit electrical power and signals between two rotating components without the need for physical contact. Unlike traditional slip rings, which use brushes or metal contacts to establish electrical connections, a contactless inductive slip ring employs electromagnetic induction to transfer power and data wirelessly across the rotating interface. The system consists of two main components: a stationary unit and a rotating unit. The stationary unit contains a set of coils, while the rotating unit features a corresponding set of coils. As the two units rotate relative to each other, the changing magnetic fields induce electrical currents in the coils, enabling the transfer of power and signals. This technology offers numerous advantages, such as reduced wear and maintenance, increased reliability, and the ability to transmit data and power without physical contact, making it suitable for various applications, including rotary platforms, robotics, wind turbines, and medical equipment.

The major global manufacturers of Contactless Inductive Slip Ring include Moog,

Schleifring, Cobham, GAT, RotarX, LTN, Mercotac, Molex, Conductix-Wampfler, NSD, Heidenhain, Kuebler, Moflon, Analog, etc. The global players competition landscape in this report is divided into three tiers.
