Research Summary

Content Disarm and Reconstruction (CDR) is a cybersecurity technology used to protect organizations from advanced and zero-day threats hidden in files and documents. It operates by scanning and sanitizing incoming files, such as email attachments or file uploads, to remove potential malicious code or exploits while preserving the file's essential functionality and structure. The process involves breaking down the files into their basic components, analyzing and neutralizing any embedded threats, and then reconstructing the files in a safe and sanitized format before allowing them to reach the intended recipients. CDR ensures that potentially harmful content is disarmed, preventing malware, viruses, and other cyber threats from infiltrating the organization's network and endpoints. This advanced security approach is highly effective in safeguarding against unknown and evasive threats that traditional antivirus solutions might miss, making it a valuable addition to an organization's cybersecurity infrastructure.
