### Research Summary

Continuous alumina fiber, also known as alumina ceramic fiber or aluminum oxide fiber, is a high-performance, inorganic fiber made from aluminum oxide ( $Al_2O_3$ ). It exhibits exceptional temperature resistance, mechanical strength, and chemical stability, making it suitable for a wide range of high-temperature applications. Continuous alumina fibers are typically produced through a melt-spinning process, where molten aluminum oxide is extruded into fine fibers. These fibers are then further processed to achieve the desired properties, such as high tensile strength, low thermal conductivity, and resistance to thermal shock. Continuous alumina fiber finds applications in aerospace, defense, automotive, and various industrial processes where its outstanding properties enable it to serve as reinforcement in composite materials, thermal insulation, and as a component in heat-resistant structures and systems.

The major global manufacturers of Continuous Alumina Fiber include 3M, Hiltex, Nitivy, CeraFib, Shandong Dongheng Coloidal Material, Dongguan Aolin New Material, etc. The global players competition landscape in this report is divided into three tiers. The

first tier comprises global leading enterprises that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
