Research Summary

A convection reflow soldering oven is a specialized piece of equipment used in the electronics manufacturing industry to solder surface mount components onto printed circuit boards (PCBs). It employs convection heating technology to transfer heat to the PCB and the solder paste, melting the solder and creating strong electrical connections between the components and the PCB. The oven operates by circulating hot air or nitrogen gas, ensuring uniform and controlled heating across the entire PCB. Convection reflow soldering ovens typically consist of multiple heating zones, each with independently controlled temperature profiles, allowing precise control over the soldering process. This technology is widely used in mass production of electronics due to its ability to produce reliable and consistent solder joints efficiently, while accommodating various component sizes and PCB configurations.

The major global manufacturers of Convection Reflow Soldering Oven include Rehm Thermal Systems, Kurtz Ersa, BTU International, Heller Industries, Shenzhen JT
