Research Summary

A conveyor sortation system is a sophisticated material handling solution used in warehouses, distribution centers, and manufacturing facilities to automate the sorting and routing of products or items. This system employs a combination of conveyors, diverters, sensors, and control software to identify, track, and redirect items based on their destination or other specified criteria. As products move along the conveyor system, sensors detect and collect data about them, allowing the control software to make real-time decisions on their sorting destination. The system then diverts each item to the appropriate output lane, chute, or conveyor, enabling efficient and accurate distribution of goods to their designated locations. Conveyor sortation systems significantly improve order fulfillment processes, reduce manual labor, and enhance operational efficiency by automating the complex task of sorting large volumes of items accurately and rapidly.

The major global manufacturers of Conveyor Sortation System include Daifuku, SSI SCHAEFER, KION Group (Dematic), Vanderlande, BEUMER, Siemens, Intelligrated,
