Research Summary

Cooking spray is a food-grade aerosol product used in the kitchen to prevent food from sticking to cooking surfaces, such as pans, grills, and baking sheets. It typically consists of a combination of vegetable oils, lecithin, and propellants that are sprayed in a fine mist onto the cooking surface. The thin layer of cooking spray creates a non-stick barrier, making it easier to cook and flip food without it sticking to the pan. Cooking spray is a healthier alternative to traditional cooking oils and butter, as it provides a minimal amount of fat and calories while still ensuring efficient cooking and easy cleanup. It is commonly used in various cooking methods, including saut'ing, baking, and grilling, and is a convenient kitchen staple for anyone looking to reduce the use of excessive fats in their cooking.
