Research Summary

A cooled InGaAs camera is a specialized imaging device that utilizes an indium gallium arsenide (InGaAs) sensor to detect near-infrared light. These cameras are often used in scientific, industrial, and research applications where infrared imaging is essential. The InGaAs sensor allows the camera to capture wavelengths in the short-wave infrared (SWIR) spectrum, typically ranging from about 900 to 1700 nanometers. The term "cooled" refers to the camera's built-in cooling system, which maintains the sensor at low temperatures during operation to reduce noise and improve sensitivity. Cooled InGaAs cameras offer high sensitivity, low dark current, and excellent signal-to-noise ratio, making them well-suited for applications such as semiconductor inspection, solar cell inspection, moisture analysis, and hyperspectral imaging, where the detection of SWIR light is critical for accurate and reliable results.

The major global manufacturers of Cooled InGaAs Camera include Allied Vision Technologies, FLIR Systems, Teledyne Princeton Instruments, Hamamatsu Photonics, Raptor Photonics, Teledyne Technologies, Xenics, First Light Imaging, GPD

Optoelectronics, IRCameras, Photon, Sofradir, etc. The global players competition landscape in this report is divided into three tiers.
