### Research Summary

A copper heat sink is a passive cooling device used to dissipate and transfer heat away from electronic components or devices. It is made of copper, a highly efficient thermal conductor, which allows it to rapidly absorb and distribute heat generated by the electronic components. The heat sink typically consists of a base and a series of fins or ridges that increase the surface area for better heat dissipation. When the electronic component, such as a CPU or power transistor, heats up during operation, the copper heat sink absorbs the heat and conducts it away from the component's surface, where it is then dispersed into the surrounding air through convection. Copper heat sinks are commonly used in computers, LED lighting, power amplifiers, and other electronic devices that require effective cooling to prevent overheating and ensure optimal performance and longevity. The superior thermal conductivity of copper makes it an excellent choice for heat sinks, as it efficiently transfers heat and helps maintain the electronic component's temperature within safe operating limits.

The major global manufacturers of Copper Heat Sink include Delta, TE Connectivity,

Aavid Thermalloy, DAU, CUI, Advanced Thermal Solutions, Radian, Akasa, Thermalright, etc. The global players competition landscape in this report is divided into three tiers.
