### Research Summary

Copper Indium Gallium Selenide (CIGS) solar cell module is a type of thin-film photovoltaic technology used to convert sunlight into electricity. The CIGS solar cells are made of a thin layer of semiconductor material composed of copper, indium, gallium, and selenium. The CIGS material is deposited onto a flexible or rigid substrate, which can be glass, metal, or polymer, to create the solar cell module. CIGS solar cells offer several advantages, including higher efficiency, lightweight, flexibility, and the ability to perform well in low-light conditions. Their manufacturing process allows for cost-effective large-scale production, making them an attractive option for renewable energy applications. CIGS solar cell modules are used in a wide range of solar panels, from small portable chargers to large-scale solar power plants, contributing to the growing adoption of solar energy as a clean and sustainable power source.
