Research Summary

Coronary stents are small, metallic, mesh-like tubes used in interventional cardiology to treat coronary artery disease (CAD). These devices are inserted into narrowed or blocked coronary arteries during a procedure called percutaneous coronary intervention (PCI) or angioplasty. The stent is positioned at the site of the blockage and then expanded using a balloon catheter, which helps to compress the plaque and open up the artery, allowing for improved blood flow to the heart muscle. Once expanded, the stent remains in place to keep the artery open and prevent it from re-narrowing. Some stents are drug-eluting, meaning they release medication that helps to reduce the risk of restenosis, the re-narrowing of the artery. Coronary stents have revolutionized the treatment of CAD, providing a minimally invasive alternative to coronary artery bypass grafting (CABG) in certain cases and offering significant benefits in terms of symptom relief and improved outcomes for patients with coronary artery disease.

The major global manufacturers of Coronary Stents include Medtronic, Boston Scientific, Biosensors, Terumo, MicroPort, Lepu Medical, B.Braun, SINOMED, Atrium

Medical, LBC, Essen Technology, etc. The global players competition landscape in this report is divided into three tiers.
