Research Summary

A coverslipper is a laboratory instrument used in histology and pathology to automate the process of covering microscope slides with coverslips. In these fields, tissue samples or cell specimens are mounted on glass slides and then covered with a thin, transparent coverslip to protect and preserve the sample for microscopic examination. The coverslipper automates this manual step, which traditionally involves applying mounting medium and carefully placing coverslips on each slide. With a coverslipper, slides are fed into the machine, and the coverslips are accurately and evenly dispensed onto the slides, ensuring a consistent and reliable covering process. This automation not only saves time and labor but also improves the quality and consistency of slide preparations, making it an essential tool in laboratories and medical facilities for efficient and high-quality slide mounting and processing.
