Research Summary

A crane counterweight is a weight or set of weights installed on a crane to counterbalance the load being lifted. Cranes use counterweights to maintain stability and prevent tipping over while lifting heavy objects. These counterweights are typically mounted on the rear of the crane's boom or on a separate counterweight carriage. They are carefully calculated and adjusted based on the weight of the load being lifted and the crane's configuration to ensure proper balance and safety. Counterweights can be made from various materials, including concrete, steel, or iron, and their size and configuration vary depending on the crane's capacity and operating conditions. By providing a counterbalancing force, crane counterweights enable cranes to safely lift and maneuver heavy loads with precision and stability.
