Research Summary

A cross-section polisher is a specialized laboratory instrument used in materials science and microscopy to prepare samples for examination under a microscope. It is primarily used to create flat and smooth cross-sectional surfaces of materials, such as metals, ceramics, semiconductors, and biological specimens. The process involves grinding and polishing the sample to a precise thickness, revealing the internal structure of the material. The cross-section polisher is equipped with a rotating sample holder, abrasive grinding wheels, and polishing pads, as well as a water-cooling system to prevent sample overheating during the preparation process. This instrument is particularly valuable for failure analysis, quality control, and research purposes, enabling scientists and engineers to study the microstructure and composition of materials, identify defects, and gain valuable insights into material properties and behavior.

The major global manufacturers of Cross Section Polisher include Leica Microsystems, Hitachi, JEOL, Gatan, Fischione Instruments, Coxem, Technoorg Linda, Beijing Aibozihiye, etc. The global players competition landscape in this report is divided into
