### Research Summary

Cryo-electron microscopy (cryo-EM) is a powerful imaging technique used to visualize the structure of biological macromolecules and complexes at near-atomic resolution. In cryo-EM, samples are rapidly frozen in a thin layer of vitreous ice, preserving them in a near-native state. The frozen samples are then imaged using an electron microscope at cryogenic temperatures. Cryo-EM allows researchers to visualize biological structures, such as proteins, nucleic acids, viruses, and cellular organelles, in their native environments without the need for staining or fixing. This technique has revolutionized structural biology by providing detailed insights into the three-dimensional shapes and organization of biomolecules, leading to breakthroughs in understanding their functions and interactions. Cryo-EM has become an essential tool for drug discovery, vaccine development, and structural biology research, offering unparalleled resolution and flexibility in studying complex biological systems.

The major global manufacturers of Cryo-Electron Microscopy include Thermo Fisher Scientific, Hitachi, JEOL, Zeiss, Cordouan, Delong, Delmic, Shuimu BioSciences,
