### Research Summary

Cryolite, with the chemical formula  $\text{Na}_3\text{AlF}_6$ , is a rare mineral primarily used in the aluminum smelting process. It acts as a flux to lower the melting point of alumina ( $\text{Al}_2\text{O}_3$ ) during the electrolysis process in the Hall-Héroult method, making aluminum extraction more energy-efficient. This white or colorless mineral can also sometimes appear in shades of brown, red, or even purple due to impurities. Originally mined extensively in Greenland, natural sources of cryolite have become scarce, leading to the development of synthetic alternatives. Besides its primary role in aluminum production, cryolite is occasionally used in ceramics, glass production, and as an insecticide. Its unique properties, including its ability to reduce the melting point of alumina significantly, make it an invaluable component in industrial applications.

The major global manufacturers of Cryolite include Do Fluoride Chemicals, Fluorsid, S.B. Chemicals, Xinhai Chemicals, Yuzhou Deyi Chemical, Zhengzhou Flworld Chemical, Henan Buckton Industry & Commerce, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command a substantial market share, hold a dominant industry

position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
