Research Summary

A Cryopump is a high-vacuum pump used to achieve and maintain ultra-high vacuum conditions in various industrial, scientific, and research applications. It operates based on the principle of cryogenics, using extremely low temperatures to trap and pump out gases from a vacuum chamber. The cryopump consists of a cold surface, typically made of a cryogenic material like liquid nitrogen or a combination of cryogenic gases, which condenses and freezes gases on contact. As gases come into contact with the cold surface, they solidify and are effectively removed from the vacuum space. Cryopumps are widely used in semiconductor manufacturing, aerospace, particle accelerators, and other fields where maintaining a clean and low-pressure environment is critical for optimal performance. They offer efficient and reliable gas removal capabilities and play a vital role in achieving high-quality vacuum conditions.

The major global manufacturers of Cryopump include SHI Cryogenics Group, Ulvac, Brooks, Leybold, Trillium, PHPK Technologies, Vacree, Edwards Vacuum, CSIC Pride (Nanjing) Cryogenic Technology, Suzhou Bama Superconductive Technology, Zhejiang

Bwokai Electromechanical Technology, Ultratorr Technology, etc. The global players competition landscape in this report is divided into three tiers.
