Research Summary

Cryotherapy units are specialized medical devices used to administer cryotherapy, a therapeutic treatment that involves exposing the body or specific body parts to extremely cold temperatures for therapeutic benefits. These units can vary in design and functionality, but they typically consist of a chamber or enclosure where the patient can be exposed to cold air or gas, such as liquid nitrogen or refrigerated air. Whole-body cryotherapy units are large chambers where the patient is briefly exposed to very cold temperatures, typically ranging from -110°C to -160°C (-166°F to -256°F). Localized cryotherapy units are smaller devices that target specific areas of the body with cold therapy, such as cryo saunas or cryo probes. Cryotherapy units are used in sports medicine for recovery and pain management, dermatology for treating skin conditions, and certain medical conditions for pain relief and inflammation reduction. It's essential to use cryotherapy units under professional supervision to ensure safe and effective treatment.
