Research Summary

Crystalline Silicon Photovoltaic (PV) cells are the fundamental building blocks of solar panels used to convert sunlight into electricity. They are made from slices of crystalline silicon wafers, which are typically either monocrystalline (made from a single crystal) or multicrystalline (made from multiple crystals). These cells contain layers of different materials that create an electric field when exposed to sunlight. When photons from the sun strike the cell, they generate electron-hole pairs in the silicon material, creating an electric current. This flow of electrons constitutes the electrical energy produced by the PV cell. Crystalline Silicon PV cells are known for their high efficiency, reliability, and long-term performance, making them the most widely used and commercially successful solar cell technology in the world. They have revolutionized the renewable energy industry by providing a sustainable and eco-friendly source of electricity for various applications, from residential rooftops to large-scale solar power plants.

The major global manufacturers of Crystalline Silicon PV Cells include LONGi Green Energy Technology, JinkoSolar, Trina Solar, JA Solar, Canadian Solar, Risen Energy,
