Research Summary

A CT (Computed Tomography) machine, also known as a CT scanner or CAT (Computerized Axial Tomography) scanner, is a sophisticated medical imaging device used to produce detailed cross-sectional images of the body's internal structures. The CT machine uses a rotating X-ray beam and detectors to capture multiple images from different angles as it moves around the patient. These images are then processed by a computer to create highly detailed and three-dimensional representations of the scanned area. CT scans are invaluable in diagnosing and evaluating a wide range of medical conditions, including injuries, tumors, infections, and vascular diseases. The non-invasive nature of CT scans and their ability to provide detailed information about organs, bones, soft tissues, and blood vessels make them an essential tool in modern medicine for guiding treatment plans and surgical interventions.

The major global manufacturers of CT Machine include GE Healthcare, Siemens Healthcare, Philips, Toshiba, Shimadzu, Hitachi, Carestream Healthcare, NeuroLogica, United-imaging, Neusoft Medical, Shenzhen Anke High-tech, etc. The global players
