Research Summary

A Cyber-Physical System (CPS) is a computing system that tightly integrates the cyber or digital world with the physical world, creating a network of interconnected devices, sensors, and actuators that interact and communicate with each other and their physical environment. CPS combines computation, communication, and control to enable seamless interactions between the digital and physical components. These systems are commonly found in various industries, including manufacturing, transportation, healthcare, energy, and smart cities. Examples of CPS include industrial automation systems, smart grids, autonomous vehicles, and wearable health devices. The integration of the cyber and physical components in CPS allows for real-time monitoring, data collection, analysis, and control, leading to enhanced efficiency, safety, and autonomy in various applications. However, the complexity and interconnectedness of CPS also present challenges related to security, privacy, and reliability, which require careful design and implementation to ensure the safety and robustness of these systems in the face of cyber threats and physical-world uncertainties.

The major global suppliers of Cyber Physical System include Siemens, Intel, ITIH, EIT Digital, Tcs, MathWorks, Galois, SEI, Astri, NIST, etc. The global players competition landscape in this report is divided into three tiers.
