Research Summary

Cyclic Olefin Copolymer (COC) is a type of thermoplastic polymer that belongs to the family of cyclic olefins. It is created through the copolymerization of cyclic olefin monomers, resulting in a transparent, amorphous, and glass-like material with excellent optical and mechanical properties. COC offers high clarity, low birefringence, low moisture absorption, and good chemical resistance, making it ideal for various applications in the medical, optical, and packaging industries. In the medical field, COC is used for syringes, medical containers, and diagnostic devices due to its biocompatibility and sterilizability. In optics, it is employed for lenses, light guides, and optical disks due to its superior transparency and minimal autofluorescence. Moreover, in packaging, COC is chosen for blister packs, film applications, and specialty containers, benefiting from its gas barrier properties and resistance to chemicals and environmental stress cracking. Its versatility, processability, and unique combination of properties have made COC a valuable material in many cutting-edge applications.

The major global manufacturers of Cyclic Olefin Copolymer (COC) include Corning,

Greiner Bio-One International, PerkinElmer, Porvair Sciences, Aurora Microplates, etc. The global players competition landscape in this report is divided into three tiers.
