### Research Summary

Cystoscopy is a medical procedure used to examine the inside of the bladder and urethra using a thin, flexible instrument called a cystoscope. The cystoscope has a light and camera at its tip, allowing the healthcare provider to visualize the urinary tract structures on a monitor in real-time. Cystoscopy can be performed for diagnostic or therapeutic purposes. In a diagnostic cystoscopy, the healthcare provider can inspect the bladder lining for abnormalities such as tumors, inflammation, stones, or infections. Biopsies or urine samples may also be taken during the procedure for further analysis. Therapeutic cystoscopy may involve procedures such as removing bladder stones, taking tissue samples (biopsies), treating bladder tumors, or performing other interventions to address urinary tract issues. Cystoscopy is commonly performed in outpatient settings using local anesthesia or sedation to minimize discomfort during the procedure. It is a valuable tool in urology for diagnosing and treating various urinary tract conditions.
