Research Summary

DBC ceramic substrate, also known as Direct Bond Copper ceramic substrate, is a type of advanced ceramic material used in high-power electronic applications. It is made by directly bonding a layer of copper (Cu) to a ceramic material, typically aluminum oxide (Al₂O₃) or aluminum nitride (AlN), through a high-temperature process called co-firing. The copper layer provides excellent thermal conductivity, allowing for efficient heat dissipation from electronic components mounted on the substrate. The ceramic layer provides electrical insulation and mechanical support. DBC ceramic substrates are commonly used in power electronic devices such as insulated-gate bipolar transistors (IGBTs) and high-power diodes, where thermal management is crucial to maintain device performance and reliability. The direct copper bonding enhances the heat dissipation capabilities of the substrate, making it suitable for applications requiring high power densities and demanding thermal conditions.

The major global manufacturers of DBC Ceramic Substrate include Rogers Corporation, Ferrotec, KCC, Shengda Tech, Heraeus Electronics, Nanjing Zhongjiang New Material,
