### Research Summary

Decentralized identity systems are innovative frameworks designed to give individuals greater control over their digital identities while ensuring security, privacy, and interoperability. Unlike traditional identity systems where identity information is stored and managed by centralized entities such as governments, corporations, or social media platforms, decentralized identity systems enable users to create, manage, and share their identities independently. These systems leverage blockchain technology and distributed ledger technology (DLT) to store identity information in a secure, decentralized manner, removing the need for intermediaries and providing users with self-sovereign identity. In decentralized identity systems, users have control over their personal data, deciding what information to share and with whom, while cryptographic techniques ensure the integrity and authenticity of identity claims. This approach enhances privacy, reduces the risk of identity theft and fraud, and promotes interoperability across different platforms and services. Decentralized identity systems have diverse applications, including digital identity verification, access management, secure authentication, and seamless identity portability across various online and offline

contexts.

The major global suppliers of Decentralized Identity Systems include Microsoft, Avast, Ping Identity, 1Kosmos, IBM, Accenture, R3, Civic Technologies, InfoCert, Ontology, Spruce ID, TrueVett (VeriME), Dock Labs, Finema, Metadium, Affinidi, Datarella, Infopulse, Dragonchain, Validated ID, Serto, Blockster Labs, Nuggets, etc. The global players competition landscape in this report is divided into three tiers.
